

HTML, CSS & JavaScript

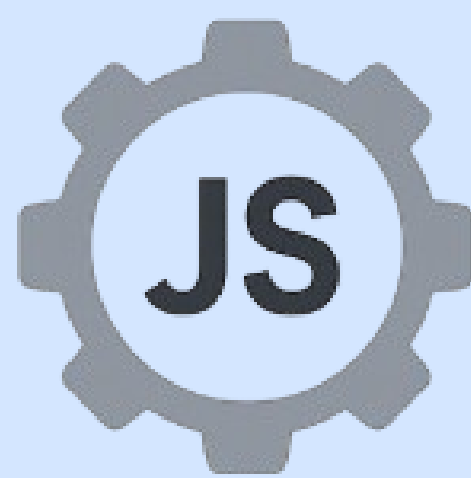

What's the Difference?

HTML

CSS

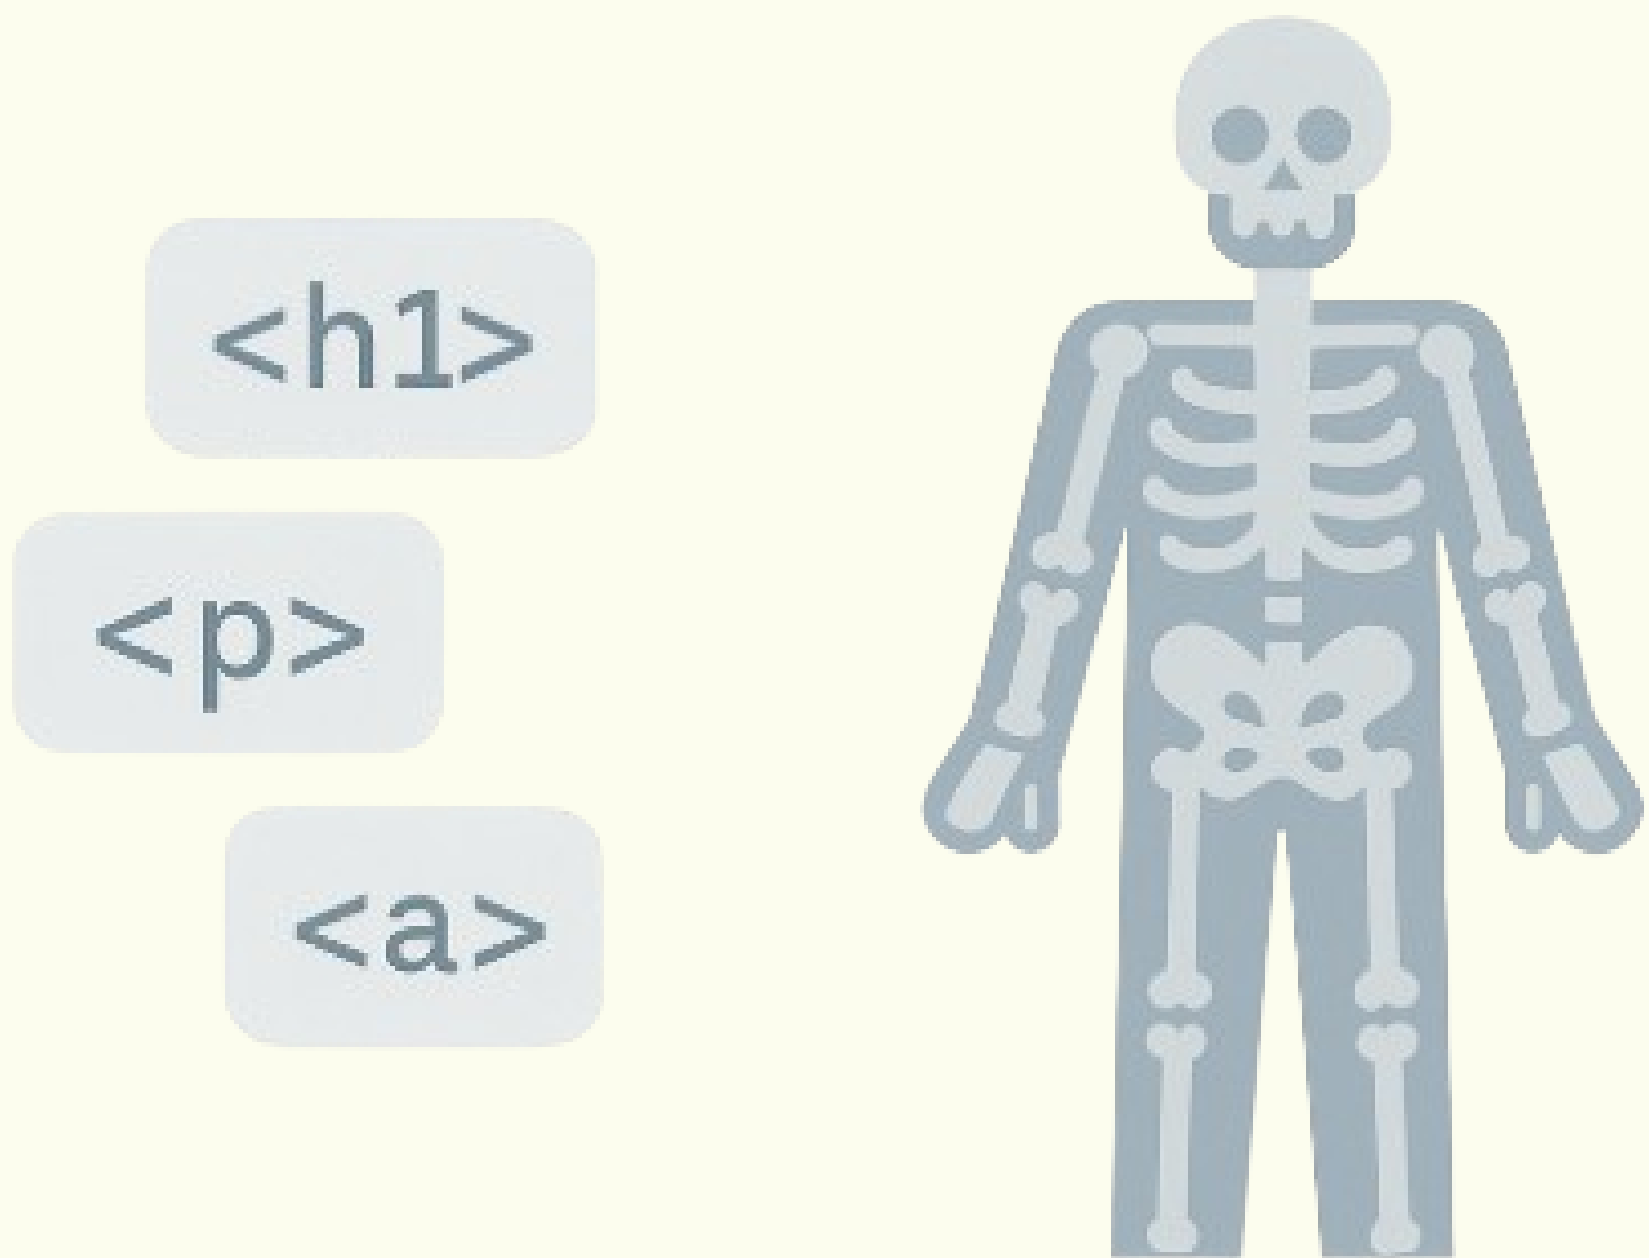

JS

HTML

(HyperText Markup Language)

It gives your webpage structure and content

- Structure of your page
- Headings, paragraphs, forms, links
- Like your body's skeleton — without it, nothing stands!

CSS

(Cascading Style Sheets)

CSS adds design, layout, and colors

- Styles your webpage
- Fonts, colors, layouts, animations
- Like fashion & design — gives your site personality!

JavaScript (Js)

JS makes your site interactive

- Makes your page dynamic
- Sliders, popups, user input
- Like your brain & nervous system — it thinks and reacts!

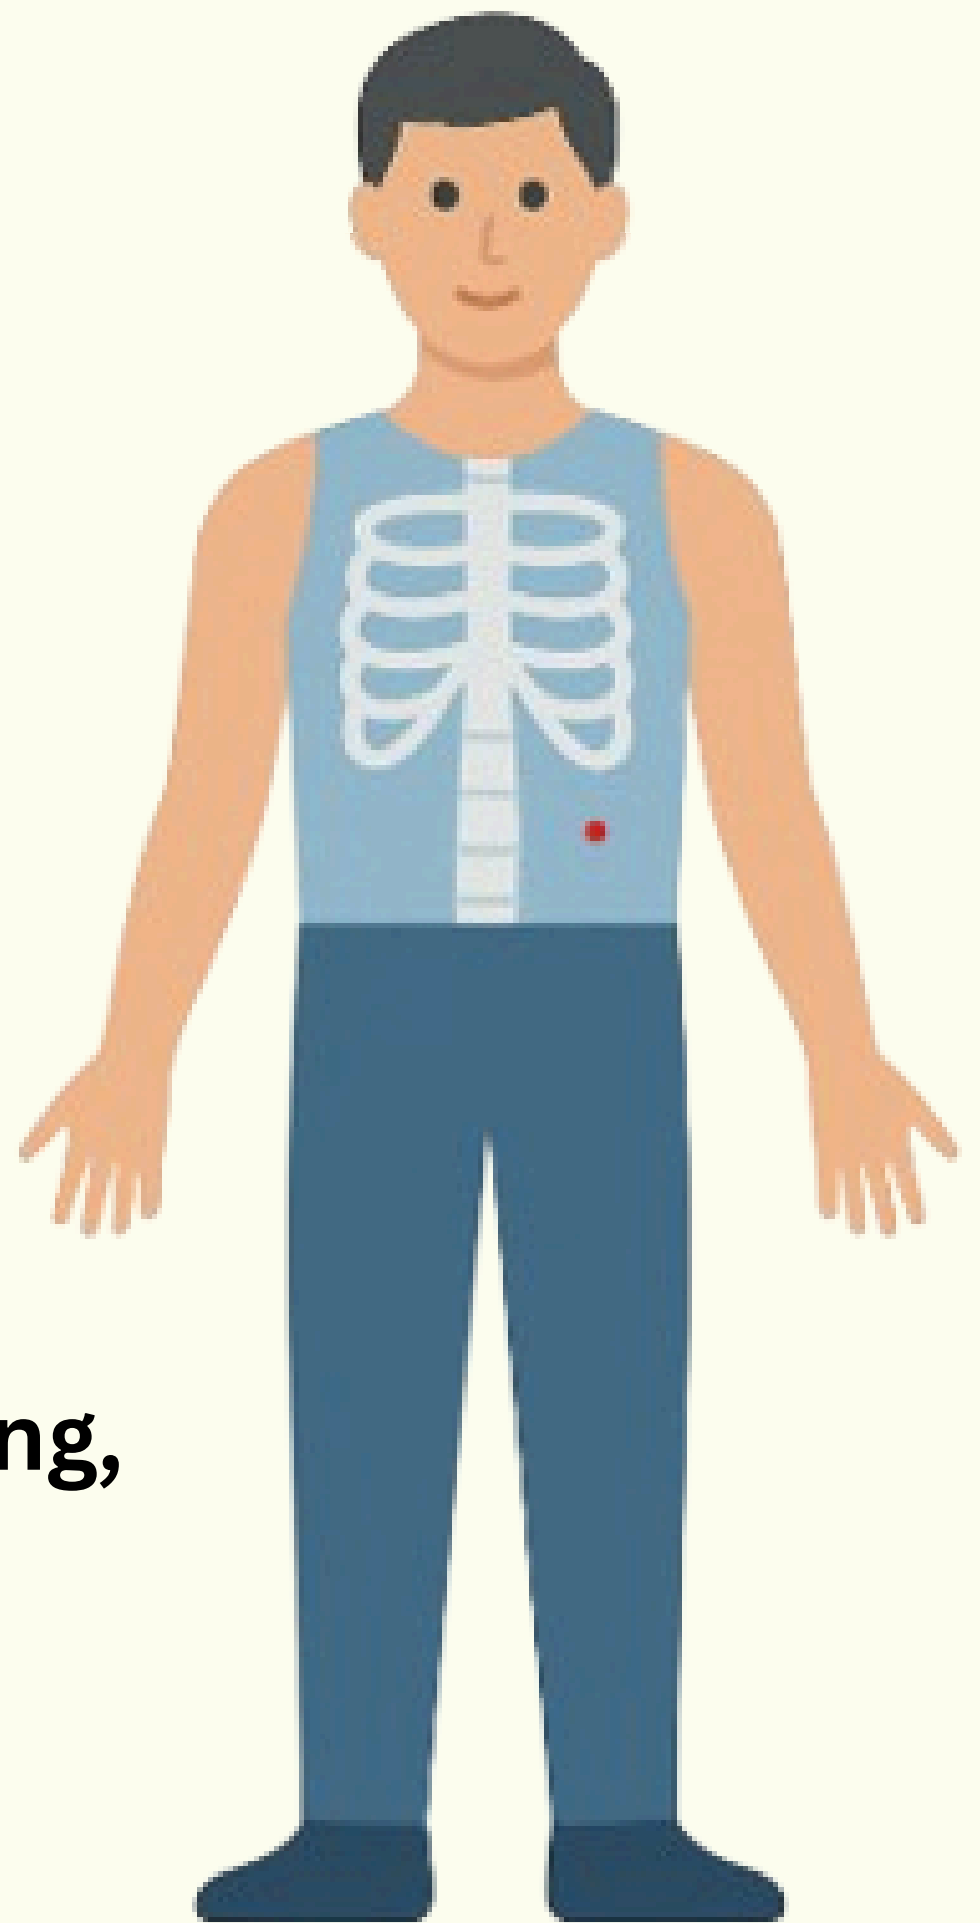

Human Body Analogy

Think of:

skeleton → HTML

skin/clothes → CSS

brain → JS

**Together, they create a living,
breathing webpage**

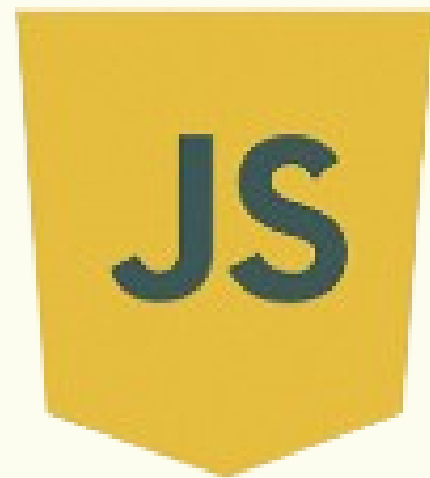

What Happens If You Use Only One?

No
styling

No
content

No
interactivity
